Dear Mr. Murry:

Enclosed with this letter are updated cross-sections (Figures 6.8a – 6.13) for Application No. UR03075. We continue to study areas within our proposed permit area in order to prepare for later applications for production area authorizations. In the course of our continuing analysis, it has come to our attention that the elevations of some of the logs used in our cross-sections – logs completed during the 1980s – were slightly higher than they should be. Specifically, these logs appeared to be uniformly elevated 10 to 12 feet higher than the actual elevation. As you know, today, using survey-grade GPS, we are capable of greater precision in surveying than operators were 20 years ago.

After we identified the apparent cause of the discrepancy, we re-surveyed all the logs used in the cross-sections using a modern, survey-grade GPS instrument. Re-surveying does not change the conclusion regarding the nature of the confining layers. In fact, the refinements themselves may be difficult to discern given the scale of the cross-sections and the subtlety of the refinements. Nevertheless, we are submitting the refinements prior to completion of your technical review in an effort to make our application as precise as possible.

Please contact me if you have any questions.

Sincerely,

*Larry L. Minter*  
Larry L. Minter, P.G.
